

ONIS Digital Architect Digital Services Platform Solution

THE CHALLENGE

Main problem and its scenario.

A major Carrier in North America wanted to create a marketplace of mobile offers and services bundled with Cloud (SaaS) services from 3rd parties. The marketplace would drive increased revenue, increase customer retention, and transform the company into a digital services provider. They needed a “Broker” to on-board 1000s of SaaS vendors and be the gateway to all the SaaS vendors performing all actions including managing users, accounts, licenses, subscriptions, etc. One of the key requirements was that the Broker must integrate with the existing IT Application stack. The Broker must support rapid on-boarding of SaaS vendors (within days) at a very high cost.

THE SOLUTION

How the ONIS team delivered the solution.

ONIS Digital Architect was integrated to the Carrier IT Application stack once again leveraging its superior integration capabilities. ONIS Digital Architect received order requests via its REST API, performed order orchestration and interfaced with one or more SaaS vendors supporting all actions including create, modify, delete, cancel, user management, license management, subscription discovery, support for add-ons, email notifications, reports, and external notifications.

THE RESULTS

Results obtained once ONIS delivered the best solution.

This use case demonstrates the power of the ONIS Digital Architect platform supporting a Cloud marketplace with rapid on-boarding of SaaS vendors. It also demonstrates that ONIS Digital Architect can be easily integrated with Carrier IT stacks without creating any dependencies. The solution is hosted in the AWS cloud.

Our Results in Numbers

- Tincidunt ornare massa eget egestas purus viverra.
- Tortor vitae purus faucibus ornare.
- Orci sagittis eu volutpat odio.
